Table 1. Summary of principal findings relating to the aim of the thesis.

Chapter	**Principal finding**
Chapter 3: Exploring the integration of environmental impacts in the cost analysis of the pilot MEL-SELF trial of patient-led melanoma surveillance	Environmental impacts can be estimated alongside costs in cost analyses. We demonstrated this using the same economic methods that identify, measure, and value resources.
Chapter 4: Methods to include environmental impacts in health economic evaluations and health technology assessments: a scoping review	There are at least ten methods to include environmental impacts in health economic evaluations and health technology assessments. We reviewed these and found few that had been demonstrated with empirical evidence.
Chapter 5: Healthcare costs and carbon emissions of stage III melanoma surveillance imaging	We estimated the health system costs and carbon emissions of diagnostic imaging by patients treated for stage III melanoma on different PET/CT surveillance schedules. When valued in monetary units the carbon emissions accounted for less than 3% of total costs.
Chapter 6: The carbon footprint of surgical and non-surgical skin cancer appointments	We estimated the carbon footprint of full skin examination, total body photography, and the excision of a lesion suspicious for melanoma using process-based life cycle assessment methods.
Chapter 7: Methods to include environmental impacts in a cost-effectiveness analysis: a case study of PET/CT surveillance imaging after surgical treatment for stage III melanoma	We performed a cost-effectiveness analysis of 12-monthly PET/CT imaging for patients treated for stage III melanoma. We compared different ways to include environmental impacts in this analysis.
Chapter 8: Towards environmentally extended health economic analysis plans: pre-specifying methods to include environmental impacts in the economic evaluation of the MEL-SELF Trial	Health economic analysis plans (HEAPs) can be expanded to describe the planned analysis of environmental impact. We suggest items to include in a HEAP for the cost-consequence analysis of the MEL-SELF randomised controlled trial.
Chapter 9: Methods to include environmental impacts in Australian health technology assessments	We proposed a simple decision matrix to include environmental impacts in Australian cost-minimisation analyses.
